VERSION	DATE	DESCRIPTION
0.9	August 28, 2026	Design approved for rollout
1.0	October 30, 2026	Handover document

Appgate and Appgate ZTNA are trademarks of Appgate.

SUMMARY

Design summary

This document describes how Appgate ZTNA was implemented at Clínica Demo, S.A. to give each user access only to the applications they need, without exposing the network.

208	6	9	15
Users migrated	Applications protected	Access policies	Validation tests

Changes from the initial situation

AREA	BEFORE	NOW
Internet exposure	Published VPN portal	Resources with no exposed ports (SPA)
Each user's reach	The entire network once connected	Only authorized applications
Third-party access	Shared accounts with no expiration	Per person and for a limited time
Device posture	Not evaluated	Evaluated before and during each session
Lateral movement	Unrestricted inside the VPN	Blocked by a session micro-perimeter

Design decisions

- Hybrid deployment model: Controller in the cloud and a Gateway at each site.
- Progressive migration, starting with clinical records as the most critical application.
- Third-party access from a browser, with nothing to install and for a limited time.

ASSESSMENT

Initial situation

Before the project, Clínica Demo, S.A. had 208 users, six applications and two sites. This table summarizes who accessed what, and how.

GROUP	USERS	ACCESSES	HOW IT CONNECTED	OBSERVATION
Physicians	60	Clinical records, medical imaging	VPN from corporate or personal device	Access to the entire network
Nursing and reception	85	Clinical records, laboratory	Internal network at each site	No segmentation between areas
Administration and HR	45	Billing, human resources	VPN from corporate device	Access to the entire network
IT	8	Server administration	VPN with a shared account	No per-person traceability
Laboratory vendor	6	Laboratory interface	VPN with a shared account	Account with no expiration
Clinical records support	4	Clinical records server	Published remote desktop	Port exposed to the internet

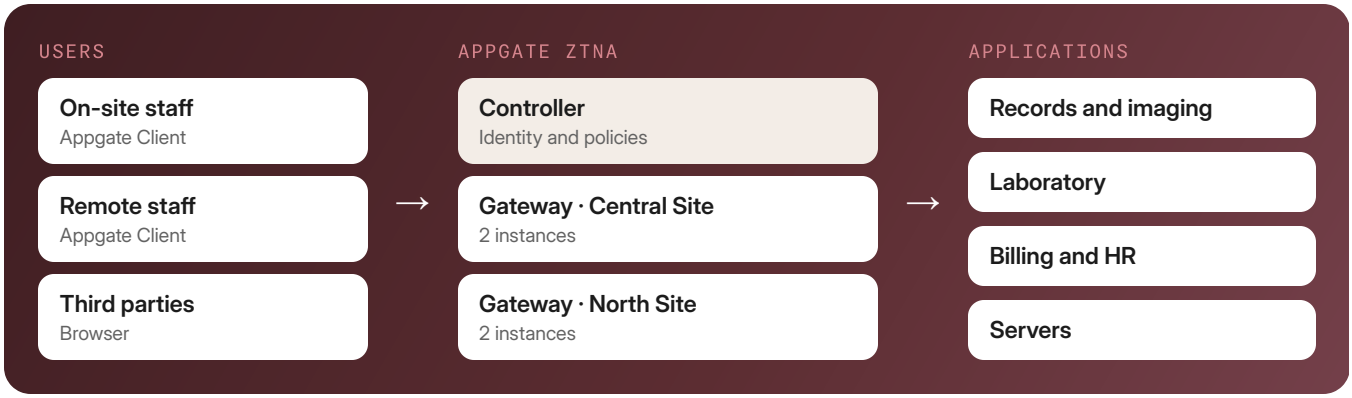

Points that guided the design

- Once connected to the VPN, any user could reach the entire internal network.
- The VPN portal and remote desktop were exposed to the internet.
- Vendors used shared accounts with no expiration date.
- Device posture was not evaluated before granting access.

DESIGN

Architecture

Traffic goes straight from each user to their applications through the site Gateway, without passing through an intermediary cloud. With Single Packet Authorization, Gateways expose no ports to unvalidated users.

Components

COMPONENT	LOCATION	FUNCTION
Controller	Cloud, 2 instances	Authenticates users and evaluates access policies.
Gateway	Central Site (2), North Site (2)	Enforces each policy and routes traffic directly to the applications.
Appgate Client	Corporate devices	Establishes the user's connection and reports device posture.
Browser access	Third parties	Lets vendors connect with nothing to install.
Identity provider	Existing at the clinic	Validates identity and the second factor.
Event log	Central Site	Keeps every access decision for review.

DESIGN

Policy matrix

This matrix defines who gets access, to what, from which device and under which conditions. Each row is a policy configured in Appgate ZTNA.

ID	WHO	TO WHAT	DEVICE	CONDITIONS
POL-01	**Physicians**	Clinical records	Profile A	Second factor. Revalidation every 8 hours.
POL-02	**Physicians**	Medical imaging	Profile A	Second factor. From the country of operation only.
POL-03	**Nursing and reception**	Clinical records, laboratory	Profile B	From each site's network only.
POL-04	**Administration**	Billing	Profile A	Second factor. 06:00 to 20:00.
POL-05	**Human resources**	HR system	Profile A	Second factor. 06:00 to 20:00.
POL-06	**IT**	Server administration	Profile C	Second factor on every connection. Session logged.
POL-07	**Laboratory vendor**	Laboratory interface	Profile D	Per-person account, 90-day validity, 07:00 to 18:00.
POL-08	**Clinical records support**	Clinical records server	Profile D	Only with a ticket approved by IT, for 8 hours.
POL-09	**Any user**	Any other resource	All	Denied by default. The resource is not visible.

Device profiles A, B, C and D are defined on the next page. Every policy is re-evaluated if the identity, device or context of the connection changes.

DESIGN

Device profiles and general rules

Device profiles

PROFILE	TYPE	REQUIREMENTS
A	**Managed corporate device**	Encrypted disk, active antimalware, updated system and registered device.
B	**Fixed site workstation**	Profile A requirements, plus connection from the site's network.
C	**Administration device**	Profile A requirements, plus a device assigned to an IT staff member.
D	**Third-party browser**	The device is not evaluated. Access is limited to one application, with no file transfer.

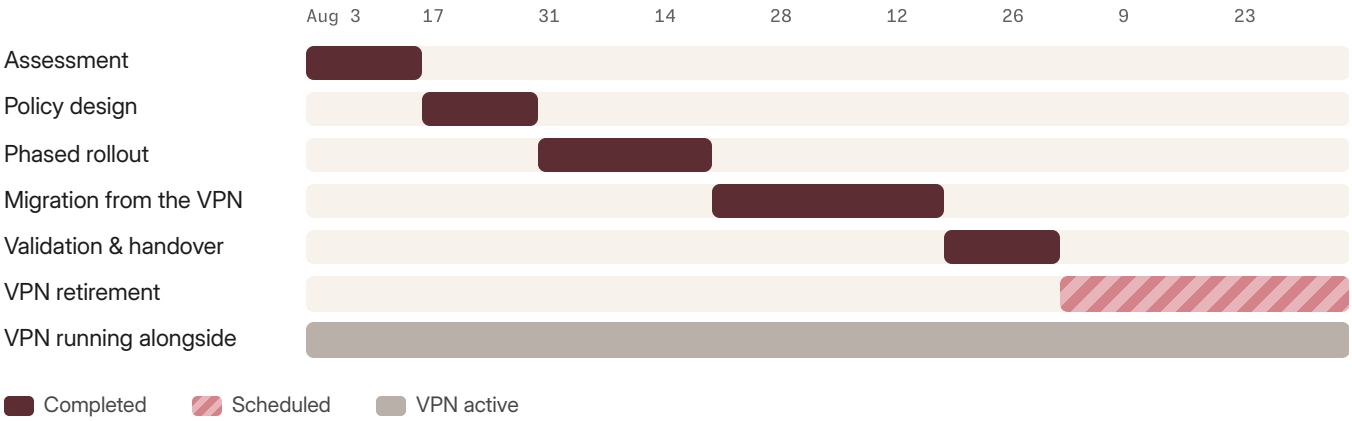

General rules

Deny by default	Anything a policy does not authorize is not visible to the user.
Continuous evaluation	If a device stops meeting its profile, access adjusts in near real time.
Session micro-perimeter	Each user reaches only what is authorized, and cannot reach other machines.
Logging	Every access decision, allowed or denied, is recorded in the event log.
Changes	Any new or modified policy requires approval from IT Management.

ROLLOUT

Rollout plan and VPN coexistence

The rollout moved forward in phases, and Appgate ZTNA ran alongside the VPN while users and applications moved over.

Migration by group

GROUP	APPGATE ZTNA START	VPN DISABLED
IT	August 31	September 4
Physicians (pilot, 15)	September 7	September 18
Physicians (remaining 45)	September 21	October 2
Administration and HR	September 28	October 9
Vendors	October 5	October 16
Nursing and reception	October 12	Did not use the VPN

Coexistence rules

- Both access methods ran side by side during migration; each group kept the VPN until its Appgate ZTNA access was confirmed.
- Each group's VPN profile was disabled after five business days with no issues.
- In case of failure, the affected group could return to the VPN the same day.

VALIDATION

Validation tests

Every policy was tested between October 19 and 28, 2026. Of 15 tests, 14 passed on the first attempt and one passed after a fix.

ID	POLICY	TEST	EXPECTED RESULT	STATUS
PRU-01	POL-01	Physician opens clinical records from a Profile A device	Access allowed	Passed
PRU-02	POL-09	Physician tries to reach billing	Denied, resource not visible	Passed
PRU-03	POL-01	Device without disk encryption tries to connect	Denied, with a user notice	Passed
PRU-04	POL-01	Antimalware is disabled during a session	Access revoked	Passed
PRU-05	POL-02	Physician opens imaging outside the country of operation	Access denied	Passed
PRU-06	POL-03	Nursing user connects from outside the site	Access denied	Passed
PRU-07	POL-04	Administration user logs in outside hours	Access denied	Passed
PRU-08	POL-05	HR user logs in outside hours	Access denied	Passed
PRU-09	POL-06	Administrator opens a session to a server	Allowed and logged	Passed
PRU-10	POL-07	Vendor connects from a browser	Sees only the laboratory interface	Passed
PRU-11	POL-07	Vendor account past its validity	Access denied	Passed
PRU-12	POL-08	Support tries to connect with no approved ticket	Access denied	Passed
PRU-13	General	Internet check of the Gateways	No visible ports	Passed
PRU-14	General	A Central Site Gateway is shut down	Access continues on the second one	After fix
PRU-15	General	Event log review	Every test appears in the log	Passed

PRU-14. On the first attempt, the connection took longer than agreed to move to the second Gateway. The Site configuration was adjusted and the test was repeated successfully.

HANDOVER

Handover document

On October 30, 2026, the solution was handed over to Clínica Demo, S.A., deployed and with its access policies configured and documented.

DOCUMENT	CONTENT
Access design	This document: initial situation, policies, rollout and tests.
Documented configuration	Details of every policy, Site and device profile configured in Appgate ZTNA.
Operations guide	User additions and removals, policy changes and event log review.
Third-party procedure	Request, approval and expiration of vendor access.
Validation results	Detail and evidence for the 15 tests performed.

Pending activities

ACTIVITY	OWNER	DATE
VPN shutdown	Clínica Demo IT	November 30, 2026
First policy review	IT Management	January 29, 2027

Support

After implementation, the Tekras team diagnoses and resolves Appgate ZTNA issues.

Acceptance

The parties confirm delivery of the solution and the documents listed.
